

Module: Automatic Control Systems

Level	Master	Short Name	ACS	
Responsible Lecturers	Hahn, Martin, Prof. DrIng.			
Department, Facility	Mechanical Engineering and Business Administration			
Course of Studies	Mechanical Engineering, Bachelor			
Compulsory/elective	Compulsory	ECTS Credit Points	4	
Semester of Studies	5	Semester Hours per Week	4	
Length (semesters)	1	Workload (hours)	120	
Frequency	WiSe	Presence Hours	60	
Teaching Language	English	Self-Study Hours	60	
The following section is filled on	ly if there is exactly or	ne module-concluding exam.		
Exam Type	Written Exam	Exam Language	English	
Exam Length (minutes)	120	Exam Grading System	One-third Grades	
Learning Outcomes	The students can apply the methods for modelling, analysis and controlle synthesis of modern mechanical engineering systems (see teaching contents).			
Participation Prerequisites	Recommended are: Mathematics (ODEs, Laplace Transformation) Basics of kinematics and dynamics as well as mechatronic systems			
The previous section is filled on	ly if there is exactly on	e module-concluding exam.		
The previous section is filled on Consideration of Gender and Diversity Issues	Use of gender-neTarget group spec	e module-concluding exam. eutral language (THL standard) cific adjustment of didactic methor versity visible (female researche

Module Course: Automatic Control Systems (Lecture)

(of Module: Automatic Control Systems)

Course Type	Lecture	Form of Learning	Presence
Mandatory Attendance	no	ECTS Credit Points	2
Participation Limit		Semester Hours per Week	3
Group Size		Workload (hours)	60
Teaching Language	English	Presence Hours	45
Study Achievements ("Studienleistung", SL)		Self-Study Hours	15
SL Length (minutes)		SL Grading System	
The following section is filled on	ly if there is a course-	specific exam.	
Exam Type		Exam Language	
Exam Length (minutes)		Exam Grading System	
Learning Outcomes			1
Participation Prerequisites			

The previous section is filled only if there is a course-specific exam.

Contents

Introduction

Model-based controller design (methods and development tools), Application of the feedback principle, terms and standards, development related to the VDI 2206 standard, block diagrams, examples (fresh water supply of a rainwater system, Control functions of modern heating systems, controlled hardware-in-the-loop test bench, active suspension vehicle systems), exercises on the basic concepts of control engineering (water level control, gas tanks).

Modelling of Control Engineering Systems

Modelling of mechanic systems, actuators, sensors and information processing systems, simplified physical models, mathematical models, 1st and 2nd order systems, step-response, impulse response.

Exercises for modelling a maglev train (modelling the mechanical subsystem, the electrical and magnetic circuit of the supporting magnet, calculation of the operating point, linearization around one operating point).

Systems Analysis

Laplace transformation (definition and calculation rules, inverse Laplace transformation, use of correspondence tables, frequently used excitation functions, limit theorems, existence of limit values), solution of differential

equations using Laplace transformation, partial fraction decomposition, transfer functions, characteristic equation, poles and zeros.

1st and 2nd order systems (calculation of eigenfrequencies and damping parameters from measured variables, poles and transient response, step response), calculation using the example of the mathematical model of a maglev train.

Stability (basic stability criterion, necessary and sufficient condition for stability, Hurwitz criterion).

Analysis methods in the frequency domain, especially for 2nd order systems (frequency response, bottom diagram, root locus curve), transfer behavior of systems, transfer functions and block diagrams, examples (radar antenna and servo valve).

Exercise Laplace transformation, transfer function and frequency response for a DC motor, calculation with transfer functions, relationship between transfer function and frequency response, transformation of block diagrams.

Controller Design

Fundamentals of linear control theory, design criteria (system structure, system parameters, parameter sensitivity/robustness, command and disturbance behaviour), requirements for the dynamic behaviour of the controlled system and calculation, basic types of controllers (P, I, D and combinations) and their behaviour, control and regulation using the example of position control of a radar antenna.

Controller, system, command and disturbance transfer functions using the example of the course control of a ship, stationary errors (position and speed), control quality, influence of disturbances on position controls.

Position control with P, PI, PD and PID controller, permanent control difference, pole specification, frequency characteristic curve method, case studies (e.g. controller design for a DC motor, feedforward control).

Literature

Dorf & Bishop, Modern Control Systems, Pearson International, 2017.

Franklin, Powell, Emami-Naeini, Feedback Control of Dynamic Systems, Pearson International, 2018.

Remarks

Module Course: Automatic Control Systems (Practical Training)

(of Module: Automatic Control Systems)

in a CAMeL-View TestRig based environment and allow to learn a model-driven design of control systems in the model, testbed and prototype phases. Objectives are: Reliable use of development tools for modelling, analysis and synthesis of closed-loop control systems Design of a controller and its test on a simulation model as well as on real hardware in the laboratory Literature Dorf & Bishop, Modern Control Systems, Pearson International, 2017. Franklin, Powell, Emami-Naeini, Feedback Control of Dynamic Systems, Pearson International, 2018.
